

Subject: Letter of recommendation – António Gomes

During the first half of 2023, António José Freitas Machado Dórdio Gomes, a student of Bachelor's Degree in Mechanical Engineering at the University of Porto, took part of a curricular internship at the Research, Development and Certification section of WEG Portugal, an industrial electric motors manufacturer, part of the multinational group WEG.

This internship aimed at the study and specification of a thermal conductivity effective method of permanently bond fins to steel frames of electric motors, and was directly oversighted by me. The project had two components: a simulation one, in which António had to use the Ansys software, and a practical one, which required the use of a test setup to compare results. In that time, António demonstrated a remarkable dedication to the project, always wanting to go beyond than expected, and good analytical and scientific skills, often offering inputs that increased the added value of the project. In interpersonal relationships, António has shown autonomy and good communications skills, and was quickly integrated not only in the project team, but also within the company.

For the reasons mentioned above, it is my opinion that António Gomes has the necessary skills, knowledge and qualities to excel in any junior mechanical engineer position. I am free to answer any questions regarding António's performance at jorgefs@weg.net.
